Amendments to the Claims:

The following listing of claims will replace all prior versions, and listings, of claims in the application:

- 1. (Currently Amended) A filter formed by spinning fiber in a semi-molten state onto a mold, wherein the filter includes the mold as a filter structural member and a filter portion forming surface of the mold is formed with a mesh.
- 2. (Currently Amended) The filter according to claim 1, wherein A filter formed by spinning fiber in a semi-molten state onto a mold, wherein the filter includes the mold as a filter structural member and the mold includes a filter portion forming surface for forming a filter portion for filtering a fluid, and a frame which surrounds the filter portion forming surface.
- 3. (Original) The filter according to claim 2, wherein a fiber protruding outside of the frame is folded in toward an inside of the frame and fixed to the frame.
- 4. (Original) The filter according to claim 2, wherein a flange is formed on an outer peripheral surface of the frame.
 - 5. (Cancelled)
- 6. (Original) The filter according to claim 2, wherein the filter portion forming surface and the frame are formed of resin.
- 7. (Original) The filter according to claim 2, wherein the filter portion forming surface is welded to an inner peripheral surface of the frame.
- 8. (Original) The filter according to claim 1, wherein the mold and the fiber are formed of the same material.
- 9. (Original) The filter according to claim 1, wherein the fiber is deposited at a constant thickness onto the mold.
 - 10. (Currently Amended) A filter comprising:

a mold; and

fiber spun in a semi-molten state onto the mold,

wherein the mold remains attached to spun fiber and functions as a structural member of the filter and a filter portion forming surface of the mold is formed with a mesh.

11. (Currently Amended) The filter according to claim 10, wherein A filter comprising:

_	mo	 	
- 1	E I I I I	 - 1	

member of the filter and the mold includes a filter portion forming surface for forming a filter portion for filtering a fluid, and a frame which surrounds the filter portion forming surface.

12. (Currently Amended) A method for manufacturing a filter comprising the steps of:

spinning a fiber in a semi-molten state onto a mold; and maintaining the mold attached to the spun fiber such that the mold functions as a filter structural member of the filter, wherein a filter portion forming surface of the mold is formed with a mesh.

13. (Currently Amended) The method according to claim 12A method for manufacturing a filter comprising the steps of:

spinning a fiber in a semi-molten state onto a mold; and

maintaining the mold attached to the spun fiber such that the mold functions as
a filter structural member of the filter, wherein the mold includes a filter portion on which the
fiber is spun, and a frame surrounding the filter portion.

- 14. (Original) The method according to claim 13, further comprising the steps of: protruding the fiber outside of the frame; folding the protruding fiber toward an inside of the frame; and fixing the protruding fiber to the frame.
- 15. (Original) The method according to claim 13, wherein a flange is formed on an outer peripheral surface of the frame.
- 16. (Original) The method according to claim 13, wherein the filter portion and the frame are formed of resin.
- 17. (Original) The method according to claim 13, wherein the filter portion is welded to an inner peripheral surface of the frame.
- 18. (Original) The method according to claim 12, wherein the mold and the fiber are formed of the same material.
- 19. (Original) The method according to claim 12, wherein the fiber is deposited at a constant thickness onto the mold.
- 20. (Original) The method according to claim 12, wherein the mold is heated prior to spinning the fiber in a semi-molten state onto the mold.
